SAFETY CHECK-OUT

After correcting the original service problem, perform the following safety checks before releasing the set to the customer:

1. Check the area of your repair for unsoldered or poorly-soldered connections. Check the entire board surface for solder splasher and bridges.
2. Check the interboard wiring to ensure that no wires are "pinched" or contact high-wattage resistors.
3. Look for unauthorized replacement parts, particularly transistors, that were installed during a previous repair. Point them out to the customer and recommend their replacement.
4. Look for parts which, though functioning, show obvious signs of deterioration. Point them out to the customer and recommend their replacement.
5. Check the B+ voltage to see it is at the values specified.

SAFETY-RELATED COMPONENT WARNING!!

COMPONENTS IDENTIFIED BY MARK Δ OR DOTTED LINE WITH MARK Δ ON THE SCHEMATIC DIAGRAMS AND IN THE PARTS LIST ARE CRITICAL TO SAFE OPERATION. REPLACE THESE COMPONENTS WITH FUJI PARTS WHOSE PART NUMBERS APPEAR AS SHOWN IN THIS MANUAL OR IN SUPPLEMENTS PUBLISHED BY FUJI PHOTO FILM CO., LTD.

4-1-3. Precautions

A. Setting of switches

Unless otherwise specified, the switches are set to the following positions and adjustment is made without a cassette inserted.

1. Camera/video power switch (S901 on FK-0 board)CAMERA
2. Standby switch (S909 on FK-0 board)STANDBY
3. Backlight correction button (S762 on SW-178 board)OFF

B. Adjustment order

As a rule, the adjustments are performed in the listed order.

C. Subjects

- 1) Color bar chart (standard picture frame)
When performing adjustment using the color bar chart, adjust the picture frame shown in Fig. 4-4.
- 2) White pattern (standard picture frame)
Remove the color bar chart from the pattern box and use the zoom button so that the white pattern has the same size and is in the same position as the color bar chart (standard picture frame).

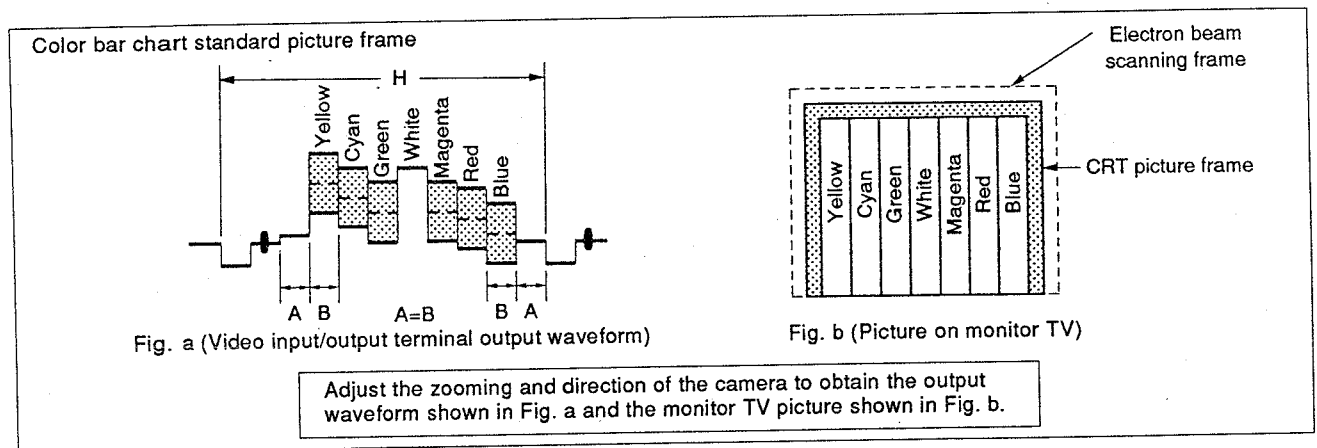

Fig. 4-4.

Fig. 4-5.

- 3) All white pattern
Remove the color bar chart from the pattern box and set the zoom ring fully to the TELE (42 mm) side.
- 4) High luminance pattern
Create the high luminance pattern as shown in Fig. 4-5., and adjust for the picture frame shown in Fig. 4-6.
- 5) Siemens star (J-6080-875-A)
Adjust the direction of the camera so that center of the Siemens star is lined up with the center of the monitor screen on the monitor TV screen.

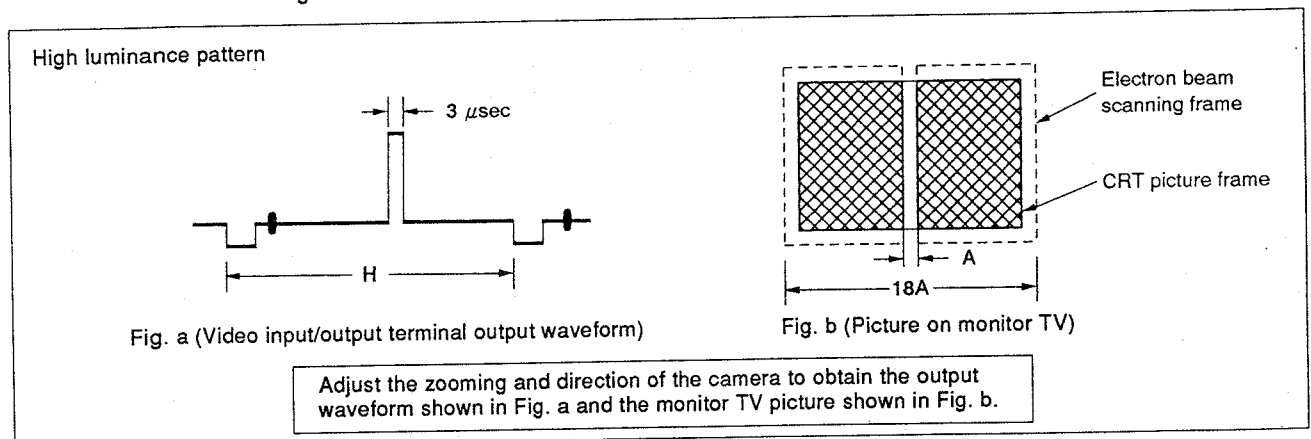

Fig. 4-6.

4-1-4. Adjustment Remote Controller

An EVR (electronic variable resistor) is used as the adjustment element for the camera block, replacing the conventional semi-fixed resistor. The EVR is controlled by the EVR/AWB microprocessor (IC361 on VC-98P board). This microprocessor reads the data written in the nonvolatile memory of the microprocessor and sends it to the EVR. The EVR D-A converts this data (8 bits for each adjustment point) and creates the adjustment voltage.

Thus, it is necessary to change the adjustment data contained in the nonvolatile memory when adjusting the camera block, and the adjustment memory is used for this purpose.

The adjustment remote controller performs bidirectional communications with the camera block microprocessor using the remote control signal lines (LANC). Adjustment address and adjustment data increment/decrement commands are sent to the camera block microprocessor from the adjustment remote controller. Adjustment address and adjustment data are sent from the camera block microprocessor to the adjustment remote controller.

A. Use of adjustment remote controller

Solder the lead wire to Pin **B6** (refer to 4-1-5.) of the check point array on the VC-98P board.

- 1) Connect the adjustment remote controller to the remote terminal (J902 on EL-13P board). (Set the HOLD switch of the adjustment remote controller to the HOLD position (SERVICE position).)
- 2) Turn on the power of the main unit.
- 3) Connect Pin **B6** (CAM ADJ) of the check point array to GND using a jumper wire.
(This connection causes the EVR/AWB microprocessor to cease normal remote control operation and to begin adjustment dedicated communications.)

Note: Be sure to make this connection only after turning on the power. The following will be displayed on the LCD of the adjustment remote controller if the connection is normal. (Adjustment data varies according to the unit.)

Fig. 4-7

- 4) Designate the desired adjustment address using the adjustment remote controller. The adjustment address is incremented by pressing the FF (▶▶) button and decremented by pressing the REW (◀◀) button. B. Precautions on use of adjustment remote controller

It is possible to accidentally erase correct adjustment data due to an error in operation of the adjustment remote controller. In order to prevent this, we recommend that you make a note of all adjustment data before adjustment and record the new adjustment data after completing each adjustment item.

Note: Data already described in the adjustment data memo column are fixed data.

- 6) The adjustment address is changed using the FF (▶▶) button or REW (◀◀) button to store the adjustment data in the nonvolatile memory or EVR/AWB microprocessor (IC361 on VC-98P board).

(The new adjustment data is not stored in the nonvolatile memory unless this operation is performed.)

4-1-6. AF Microprocessor Data Reading Jig

The AF microprocessor data reading jig converts the serial data (output data varies according to hall (iris) state, focus state, focus motor speed, zoom ring position, etc.) for adjustment output from the AF microprocessor (IC613 on VC-98P board) into a 2-digit hexadecimal code and displays it on the LED.

Connections:

Connect as shown in the diagram below.

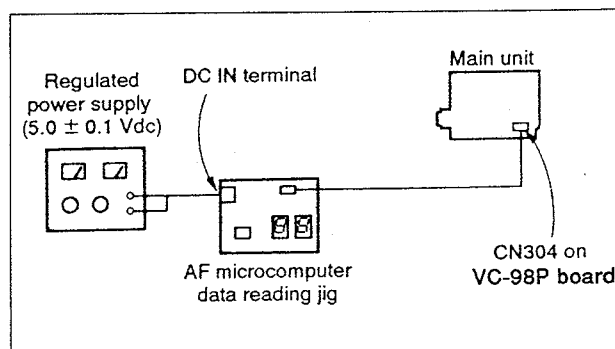

Fig. 4-9.

4-1-7. Data Processing

For some of the adjustment items, calculation from the data (hexadecimal) indicated on the AF microprocessor data reading jig and adjustment remote controller is needed to obtain the adjustment data. In these cases, convert the hexadecimal values to decimal before calculation and reconvert the result to hexadecimal to obtain the adjustment data. A hexadecimal — decimal conversion table is shown in Table 4-5.

4-2. Camera System Adjustments

4-2-1. Flange Back Adjustment

Subject	Siemens star (2 m directly in front of lens reference plane (CCD imager))
Measurement Point	Check with a monitor TV
Measuring Instrument	
Adjusting Element	Flange back adjusting pin
Tools	Phillips screwdriver, flat blade (-) screwdriver

Adjusting method:

- 1) Press the FOCUS switch (S757 on CF-0 board) to set to the MANUAL mode.
- 2) Position a Siemens star 2 m directly in front of the lens reference plane (See Fig. 4-2.).
- 3) Orient the camera block to have the center of the Siemens star imaged on the monitor TV screen coincide with the monitor screen center.
- 4) Check to assure the smooth motion of the zoom ring to both its extreme WIDE position (7 mm) and TELE position (42 mm) after pressing the zoom button, and then set it at the extreme WIDE position. (In this process, also check the monitor image to assure proper zooming operation.)
- 5) Select adjustment address 25 with the adjustment remote controller and enter adjustment data of 07. (Iris open mode) At this time, adjust the illumination on the Siemens star or place an ND filter over the lens, and confirm that the proper image is displayed on the monitor TV screen.
- 6) Set the lens focusing mark at the center of "2".

Fig. 4-10.

- 7) Loosen flange back setscrew ① with a Phillips screwdriver. (See Fig. 4-12.)
- 8) By turning the flange back adjustment Pin ② while watching the monitor screen, attain the optimum definition of a wedge at the Siemens star center on the screen. (Turn it a few times to the left and right to ensure optimum definition.)

Note: Do not turn the adjusting pin excessively in either direction.

- 9) While holding the flange back adjusting Pin ② to prevent further rotation, retighten the flange back setscrew ①.

- 10) With the zoom ring fixed at its WIDE end, turn the focusing ring and set it to the position that provides the optimum definition image of the wedge. Check to assure the focusing mark protrusion position is within the range shown in Fig. 4-11. Also, rotate the focusing ring to the close (1.1 m) and far (∞) extremes and confirm that the wedge is no longer in focus.

Fig. 4-11.

Fig. 4-12.

- 11) Fix the zoom lever at the extreme TELE position.
- 12) Turn the focusing ring and stop at the position where the wedge has optimum definition. Confirm that the focus mark is within ± 1.5 mm from the center of "2".
- 13) Select adjustment address 25 with the adjustment remote controller and enter adjustment data of 00. (Iris normal)
- 14) Change the adjustment address to store the adjustment data in the memory.

4 Camera Adjustments

4-2-2. Wide Converter Focus Adjustment

This adjustment is not needed unless otherwise the zoom lens or CCD unit was replaced.

Adjusting method:

(Make this adjustment after the flange back adjustment.)

- 1) Remove the focus window (acryloyl made) of the cabinet R by pushing it from inside of the cabinet R using a screwdriver. (The focus window cannot be reused.)
- 2) Mount up the camera completely.
- 3) Position a Siemens star 1 m directly in front of the lens reference plane.
- 4) Loosen the setscrew.
- 5) Turn the adjusting cam while setting in and out the wide converter lens of the cabinet F so that both a long distance (more than 20 m) and the Siemens star are focused, then tighten the setscrew.
When tightening the setscrew, set the wide converter in and confirm the focus again.
- 6) After tightening the setscrew, set the wide converter in and confirm the focus again.

Table 4-9. (2)

Subject	White pattern standard picture frame
Filter	Filter C14 for color temperature correction
Measurement Point	When vectorscope used: video output terminals
Measuring Instrument	When oscilloscope used: CH1 (X): emitter of Q257 (B-Y) CH2 (Y): emitter of Q255 (R-Y)
Specified Value	See Fig. 4-35.

Checking method:

- 1) Select adjustment address 75 with the adjustment remote controller and enter adjustment data of F0. (Auto white balance tracking zone invalidity/all area discrimination mode setting)
- 2) Change the adjustment address to store the adjustment data in the memory.
- 3) Remove the jumper wire between Pin **B6** of the check point array and the ground.
(Set the EVR adjustment mode to OFF.)
- 4) Confirm that the white luminance point matches with the origin (or the black luminance point) when shooting the white pattern without the C14 filter.
- 5) Cover the lens with the C14 filter and confirm that the white luminance point matches with the origin (or the black luminance point) in about 2 seconds.
- 6) Connect Pin **B6** of the check point array to the ground with the jumper wire.
(Set the EVR adjustment mode to ON.)
- 7) Select the adjustment address 75 with the adjustment remote controller and the adjustment data of 00.
(Release auto-white balance check mode)
- 8) Change the adjustment address to store the adjustment data in the memory.
